

# Application Setup

Capstone: Photo Tourist Web Application

## In this lecture, we will discuss...

- ✧ Choosing a development database
- ✧ Choosing a server application type
- ✧ Instantiating a server application
- ✧ Readyng the database

	<b>updated controller to use view</b> ejavaguy committed 2 days ago	 3247edb <>
	<b>rake db:migrate</b> ejavaguy committed 2 days ago	 f085aad <>
	<b>rails-api g scaffold Foo name</b> ejavaguy committed 2 days ago	 68edcfc <>
	<b>added rdbms test details</b> ejavaguy committed 2 days ago	 385ef25 <>
	<b>added tzinfo-data for mswin</b> ejavaguy committed 2 days ago	 ea8c62a <>
	<b>requirements listed</b> ejavaguy committed 2 days ago	 beb6332 <>
	<b>rails g rspec:request APIDevelopment</b> ejavaguy committed 2 days ago	 c894ae8 <>
	<b>initial rake db:migrate</b> ejavaguy committed 2 days ago	 a237b51 <>
	<b>rails g rspec:install</b> ejavaguy committed 2 days ago	 c8be127 <>
	<b>added rspec-rails gem</b> ejavaguy committed 2 days ago	 4b43f52 <>
	<b>jbuilder</b> ejavaguy committed 3 days ago	 16cf1e2 <>
	<b>isolated production from dev/test defaults</b> ejavaguy committed 3 days ago	 8ca645e <>
	<b>pg Gemfile</b> ejavaguy committed 3 days ago	 2f00eb2 <>
	<b>postgres config/database.yml</b>	

# Some Questions Before We Start

- ✧ Which RDBMS database do we use?
  - Functional, lightweight administration
    - Non Database-centric examples
  - Production-capable, robust
    - Consistency between development and deployment
- ✧ Which server type do we use?
  - Full Rails
    - Using server-side web pages (e.g., ERB)
    - Nearly all features turned on by default (e.g., Views, Asset Pipeline)
  - Just the API
    - Using client-side web pages (e.g., Javascript, Angular)
    - Server primarily provides API to client-side web pages
    - Lighter-weight, requires manually turning on features as needed

# Development Database: Simple or Consistent?

## SQLite

- ✧ Requires no setup
  - Easy to deploy
- ✧ Does not support foreign key constraints
  - Database schema not reported
  - Requires development and production support
- ✧ Not supported by Rails
  - Requires shared database at production

```
source 'https://rubygems.org'
```

```
gem 'rails', '4.2.6'
```

```
gem 'rails-api'
```

```
gem 'jbuilder', '~> 2.0', '>=2.6.0'
```

```
group :development do
```

```
  gem 'spring', '~>2.0', '>=2.0.0'
```

```
  gem 'sqlite3', '~>1.3', '>=1.3.12'
```

```
end
```

```
group :production do
```

```
  gem 'pg', '~>0.19', '>=0.19.0'
```

```
end
```

# Development Database: Simple or Consistent?

## SQLite

- ✧ Requires no database server setup
  - Easy to deploy examples
- ✧ Does not support (ignores) foreign key constraints
  - Database schema design errors not reported when implemented
  - Requires debug
- ✧ Not supported by Heroku
  - Requires shift to separate database at deployment

## PostgreSQL

- ✧ Requires database server installation
  - Worth the time/trouble for real development
- ✧ Full production support
  - No difference between development and production
- ✧ Fully supported by Heroku
  - Extremely easy to provision free instance

# Development Database: Simple or Consistent?

## SQLite

- ✧ Requires no database server setup
  - Easy to clone
- ✧ Does not support foreign keys
  - Database schema design errors not reported when implemented
  - Requires debug
- ✧ Not supported by Heroku
  - Requires shift to separate database at deployment

## PostgreSQL

- ✧ Requires database server
  - No difference between development and production
- ✧ Fully supported by Heroku
  - Extremely easy to provision free instance

```
$ bundle --without production
```

# Summary

- ✧ Covered Database and Server topics
- ✧ Ready to instantiate our server

## **What's Next?**

- Create the application (live)
